

# **Magic Drilling Instructions**

The Core: Magic Symmetric Mass Bias Core

The Magic Symmetric Mass Bias Core is designed to provide bowlers with the dynamic properties that would allow the Magic to pull down lane, while also picking up its roll to the pocket in sharp, angular motion.

The Coverstock:

In our continued pursuit to be the innovator in coverstock technology the R&D Chemist team at Ebonite International has identified another component of coverstock performance. This new component is called coverstock texture, and we have found that we can now enhance backend ball motion independent of oil absorption by manipulating and adjusting different ratios of the chemical components of our cover. We proudly introduce Flexol Reactive!

Ball Care –Ebonite strongly suggests that by using Abralon Pads as well as Ebonite Powerhouse products. As far as cleaning, we recommend that you use Ebonite Powerhouse Energizer Ball Cleaner. As your ball starts to decrease in performance, you may need to refresh the cover with the Ebonite Hook Again System.

As a side note, the Magic is released at 4000 Abralon Sanded. As the ball rolls down the lane, the surface will change. In order to keep your ball at peak performance, we suggest reviewing the Ebonite Ball Maintenance Guide for your Daily Ball Maintenance requirements.
